

Insulin Therapy at No Cost to You

Insulin therapy is often an important part of diabetes to manage blood sugar and prevent complications such as eyesight, nerve and kidney damage.

Insulin therapy helps prevent diabetes complications by keeping your blood sugar within your target range. If you have type 1 diabetes, insulin therapy is vital for replacing the insulin your body doesn't produce. Sometimes people with type 2 diabetes or gestational diabetes need insulin therapy if other treatments haven't been able to keep blood glucose levels within the desired range.

The following insulin therapy medications are covered as preventive care, which means you can get your insulin prescription filled at no cost to you.
